

# ApplImage

An ApplImage can now be downloaded on any Linux distribution and simply “double click it” and it works. No need for any install. It is a “download and use” case.

Want to remove it? Just delete it!

The huge advantage is that the app will work. Almost 100% of the time, since all it needs is in that one file.

## Why?

So, why are we interested in such packaging systems when we have hundreds of thousands of apps in TROMjaro’s library?

Because more and more of the newer apps ship in this new format.

We have tried to convert them to “our” format (the non-contained one) but this means a lot of work and maintenance. So we either put a lot of work in converting these new contained apps into the TROMjaro non-contained format, or accept the contained format. And we think is better for now to accept the contained format in the form of ApplImages that TROMjaro already supports. Thus, from now on we will recommend ApplImages too in our APPS section of the website. They won’t update automatically like the other apps, but we can work around this.

## This is how such apps look in our APPS section:

# TROMJaro

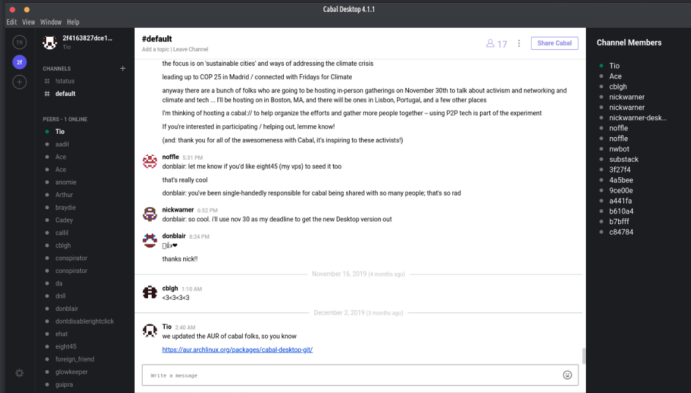

MENU

## CABAL

[DOWNLOAD AND INSTALL \(4.1.1\)](#)

*this is an AppImage - please read [this](#)*

**DESCRIPTION:**

No servers are needed to join a cabal, or to start your own. Everything is stored and runs locally. A cabal can never go down or be taken away.

A cabal is identified by its secret key (cabal://f99b453506b974...) that you share with your friends. This key lets them find and join the cabal.

Cabal works over the internet, but also lets you chat over the local network. If offline, you can still browse your full chat history, and send messages that will be sync'd with any future peers you connect to.

You are logged in as **filu** [Log out](#)

 Start the discussion...

So the only difference is the button's color (blue now) and the fact that we add the version of the ApplImage to the button itself. This helps users keep track of the version. Underneath the button there's a text reminding people that this is a different kind of packaging and a link to this article.

How about the updates? It is great that in TROMjaro all updates are handled at once via the Add/Remove Software for the "normal" apps- But not for Applimages. In order to make it easy for people to handle ApplImage updates we will keep an eye on every ApplImage that we post in the APPS section and update the download button to the new version. If anyone wants to get an email every time an update is pushed to any ApplImage from our APPS section, simply go to the comments section of the app and click "subscribe" + select "see follow-up comments". Add your email and that's it. You will get an email every time there is a new ApplImage for that particular app.

The screenshot shows a comment form with the following elements:

- A "Join the discussion..." header with a user icon placeholder.
- Input fields for "Name\*", "Email\*", and "Website".
- A "Post Comment" button with a shield icon and the text "This comment form is under antispam protection".
- A "Subscribe" dropdown menu with a red arrow pointing to it.
- A "Notify of" dropdown menu with "new follow-up comments" selected and underlined in red.
- An "Email" input field with a red box around it and a right-pointing arrow button.
- Sorting options: "newest", "oldest", and "most voted".

Applimages will look and function the same way that any other apps do on TROMjaro. Adopting this contained packaging system allows us to recommend even more trade-free applications. But we would like to stop at this, since we do not want to create a monster out of TROMjaro.

We think that a centralized way of installing and updating apps is the best and easiest. Applimages are disturbing a bit the TROMjaro waters, but it is a "compromise" we can accept. Maybe in the future we will find a way to only rely on the core "software center" in TROMjaro for installing applications. In any case, only a tiny percentage of the recommended apps will be Applimages.

So, embrace Applimages! They are great. They work. It is easy to install and remove them. And we keep an eye on the "updates" part and notify you

about that.
