

Minor and distribution releases - DistroWatch

- [Milis 2.3-2026.02.03](#) (2026/02/04 10:01)

Milis Linux is an independently-developed Linux distribution supported by Akdeniz University in Antalya, Turkey. It is built using the Linux From Scratch (LFS) project and it includes a custom package management utility called Milis Paket Sistemi (MPS). Milis Linux deploys Wayland as the default graphic server with the labwc window-stacking compositor, the Waybar Wayland bar and Sakura terminal emulator to create a functional desktop user interface.

- [GNOME OS 990940](#) (2026/02/04 08:02)

GNOME OS is an experimental, immutable Linux distribution that ships the latest in-development GNOME desktop, core applications and stack. It serves as a reference for developers and testers. It is designed around the modern systemd and GNU-based userland built from the Freedesktop SDK. Initially, GNOME OS used a library and set of utilities called OSTree to deploy the root filesystem and manage updates, but later migrated to "systemd-sysupdate" which offers enhanced immutability, auto-updating, adaptability, factory reset, uniformity and other modernised security properties. GNOME OS can be loaded as a live image in Boxes, VirtualBox, QEMU and other virtualisation software, but it can also be installed on a standard x86_64 hardware. The distribution does not support traditional package management; however, additional software applications can be installed via the Flatpak utility which is supported out of the box.

- [Vendefoul 20260203](#) (2026/02/03 17:10)

Vendefoul Wolf is a set of lightweight, Devuan-based Linux distributions featuring various popular desktop environments, including Budgie, Cinnamon, KDE Plasma, LXQt, Trinity and Xfce. As the init software, it offers a choice between SysV and runit. Some of the distribution's other main features include the LibreWolf web browser, the Calamares system installer, an application store, and its own repository of software packages. Besides the main edition, Vendefoul Wolf also produces various community spins with alternative desktops and window managers.

- [ZimaOS 1.5.4](#) (2026/02/03 11:38)

ZimaOS is an independently-developed, Linux-based operating system for personal servers and network-attached storage (NAS) devices. It features system-level support for remote access, RAID configuration, over-the-air (OTA) updates, and a browser-based user interface for managing the server. It is developed in China by IceWhale Technology Limited, which also produces and sells specialist storage hardware devices called "ZimaCube". Besides ZimaOS which is a complete, standalone operating system, the company also produces CasaOS, a lightweight software layer that can be installed on top of an existing Linux installation in order to turn it into a personal server or a NAS.

- [Helwan 3.0](#) (2026/02/03 09:34)

Helwan Linux is an Arch-based Linux distribution designed for home, education and development use. Its "Home" flavour comes with the GNOME desktop, the "Edu" variant ships with Xfce and the "Dev" edition features the Cinnamon desktop together with a range of compilers and interpreters, including PHP and Rust. The project also produces a comprehensive "Distro Building" manual with a guide to the Archiso tool (for building custom Arch-based ISO images) and the Calamares system installer.

- [Archcraft 2026.02.02](#) (2026/02/03 08:29)

Archcraft is a minimal Linux distribution based on Arch Linux. The project provides a graphical user interface using minimal window managers rather than full featured desktop environments. Archcraft is installed using the Calamares system installer and includes the yay package manager to facilitate fetching software from the Arch User Repository.

- [BunsenLabs Carbon-rc3](#) (2026/02/03 06:41)

BunsenLabs Linux is a distribution offering a light-weight and easily customizable Openbox desktop. The BunsenLabs distribution is based on Debian's Stable branch and is a community continuation of the CrunchBang Linux distribution.

- [CentOS 10-20260202.0](#) (2026/02/02 19:50)

CentOS as a group is a community of open source contributors and users which started in 2003 and has been sponsored by Red Hat since 2014. CentOS Linux versions up to CentOS Linux 8 are 100% compatible rebuilds of Red Hat Enterprise Linux, in full compliance with Red Hat's redistribution requirements. In 2020 it was announced CentOS Linux is being discontinued and replaced with CentOS Stream, a developer-focused distribution which acts as a middle-stream between Fedora and Red Hat Enterprise Linux.

- [Liya 2.5.1](#) (2026/02/02 18:45)

Liya Linux is an Arch Linux-based, rolling release distribution. The project uses the Calamares system installer to set up the distribution which offers users the Cinnamon desktop environment, Pamac graphical package manager and OnlyOffice. The system is intended to be easy to use, easy to explore and distraction-free.

- [Regata 25.1.0](#) (2026/02/02 17:42)

Regata OS is a Brazilian Linux distribution based on openSUSE, focusing on desktop and gaming needs. Its main characteristics include a Regata OS store for installing applications and games, out-of-the-box integration with Google Drive, support for a gaming mode via the Vulkan graphics API, an extensive library of games in the Regata OS Game Access portal, support for configuration of hybrid graphics in notebooks, and easy transfer of files between a computer and a smartphone. The distribution's user interface is KDE Plasma.

- [KDE Linux 20260202](#) (2026/02/02 14:04)

KDE Linux is a user-focused, general-purpose Linux distribution. It is built by KDE and it is meant to showcase the best implementation of everything KDE has to offer, using the most advanced technologies. The distribution's base packages come from Arch Linux, while everything else is either compiled by the kde-builder tool or included as Flatpak packages. KDE Linux does not come with any traditional package manager, but supports installing Flatpak, Snap or AppImage applications. As it has an immutable base, system updates involve replacing the operating system image with an entirely new one.

- [MocaccinoOS 26.02](#) (2026/02/02 13:02)

MocaccinoOS is an independently-developed Linux distribution that has its origins in source-based Gentoo Linux and Sabayon Linux. It uses a custom-built package manager called "Luet", which acts as a front-end for container-based software. The distribution's main features are minimalism and small footprint, ease of use, native vanilla Linux kernels, and support for most important cloud technologies. MocaccinoOS is offered in several variants, including live images with GNOME, KDE Plasma, MATE and Xfce desktops, as well as command-line-only "Minimal Desktop" edition.
