- [\[WIKI\] Manjaro Linux Wiki unavailable](#) (2026/05/17 11:41)

The Manjaro Linux Wiki pages is temporarily unavailable. There is no timeline for when it will be back up. What appear to be abusive AI crawlers has taken the service down several times. A temporary page with link to the forum as been setup on <https://wiki.manjaro.org> linking to the forum. The previous maintainer left Manjaro years ago and it will take some work to get a deeper understanding of how the containers were put together. 4 posts - 1 participant Read full topic

- [\[ALERT\] ssh-keysign-pwn, unprivileged users are able to read root-owned files](#) (2026/05/15 04:02)

Read root-owned files as an unprivileged user. Pre-31e62c2ebbfd kernels (everything in stable as of 2026-05-14). The bug `__ptrace_may_access()` skips the dumpable check when `task->mm == NULL`. `do_exit()` runs `exit_mm()` before `exit_files()` — no `mm`, `fds` still there. `pidfd_getfd(2)` succeeds in that window when the caller's `uid` matches the target's. Reported by Qualys, fixed by Linus 2026-05-14. Jann Horn flagged the FD-theft shape in October 2020. Six years. Mitigation Don't run your PC if you don't need it. Lock yourself in and look over your sholder ... Fix Linus Torvalds himself patched the kernel: Making sure you're not a bot!. We have to see on when we patch our supported kernels ... More info github.com/0xdeadbeefnetwork/ssh-keysign-pwn: Steal SSH host private keys and `/etc/shadow` via... Steal SSH host private keys and `/etc/shadow` via the `ptrace_may_access mm=NULL` bypass + `pidfd_getfd`. Pre-31e62c2ebbfd kernels. 32 posts - 14 participants Read full topic

- [\[ALERT\] CopyFail 3.0 - Fragnesia - Unpatched vulnerability](#) (2026/05/13 18:15)

Fragnesia is a universal Linux local privilege escalation exploit, discovered with V12 by William Bowling with the V12 team. Fragnesia is a member of the Dirty Frag vulnerability class. This is a separate bug in the ESP/XFRM from `dirtyfrag` which has received its own patch. However, it is in the same surface and the mitigation is the same as for `dirtyfrag`. It abuses a logic bug in the Linux XFRM ESP-in-TCP subsystem to achieve arbitrary byte writes into the kernel page cache of read-only files, without requiring any race condition. The technique extends the page-cache write bug class that includes Dirty Pipe: when a TCP socket transitions to `espintcp` ULP mode after data has already been spliced from a file into the receive queue, the kernel processes the queued file pages as ESP ciphertext. The AES-GCM keystream byte at counter block position 2, byte 0 is XORed directly into the cached file page. By selecting the IV nonce to produce a desired keystream byte, any target byte in the file can be set to any value — one byte per trigger invocation. The exploit builds a 256-entry lookup table mapping each possible keystream byte to its corresponding nonce, then iterates over a payload, firing the splice/ULP race for each byte that needs changing. It writes a small position-independent ELF stub (`setresuid/setresgid/execve /bin/sh`) over the first 192 bytes of `/usr/bin/su` in the page cache, then calls `execve("/usr/bin/su")` to obtain a root shell. The page cache modification is not backed to disk; the on-disk binary is untouched. No kernel is patched against this one yet! Mitigation `rmmod esp4 esp6 rxrpc printf 'install esp4 /bin/false\ninstall esp6 /bin/false\ninstall rxrpc /bin/false\n' > /etc/modprobe.d/dirtyfrag.conf` Possible patches are currently discussed upstream: `netdev - [PATCH net] net: skbuff: preserve shared-frag marker`

during coalescing Making sure you're not a bot! Making sure you're not a bot! More info: [pocs/fragnesia at main · v12-security/pocs · GitHub oss-security - Linux kernel LPE \("fragnesia", copyfail 3.0\) 17 posts - 12 participants](#) [Read full topic](#)

- [\[ALERT\] Dirty Frag \(CVE-2026-43284, CVE-2026-43500\) - Root Privilege Vulnerability](#) (2026/05/08 04:16)

A week after Copy Fail, researcher Hyunwoo Kim disclosed a second Linux kernel flaw in the same broad area — IPsec ESP and rxrpc — that they have named Dirty Frag. The bug lives in the in-place decryption fast paths of esp4, esp6, and rxrpc: when a socket buffer carries paged fragments that are not privately owned by the kernel (e.g. pipe pages attached via splice(2)/sendfile(2)/MSG_SPLICE_PAGES), the receive path decrypts directly over those externally-backed pages, exposing or corrupting plaintext that an unprivileged process still holds a reference to. Like the previous Copy Fail vulnerability, Dirty Frag immediately yields root on all major distributions. Every supported Manjaro release is affected. Dirty Frag chains two distinct kernel bugs, each with its own CVE: CVE-2026-43284 covers the IPsec ESP half (esp4 / esp6), and CVE-2026-43500 (NVD entry pending) covers the rxrpc half. Per Hyunwoo Kim's public disclosure on oss-security (2026-05-07), the responsible-disclosure embargo was broken before distributions could coordinate, and a working exploit is publicly available. A second public exploit, Copy Fail 2: Electric Boogaloo, targets the same vulnerability under a different name; both reach root through the same esp4/esp6/rxrpc code paths and are blocked by the same fix. More information about the vulnerability: Public disclosure on oss-security: oss-security - Dirty Frag: Universal Linux LPE Researcher write-up: <https://dirtyfrag.io> Upstream fix for ESP: Making sure you're not a bot! initial rxrpc fix on the netdev list: Making sure you're not a bot! updated rxrpc fix on netdev list: Making sure you're not a bot! Temporary mitigation You can neutralize the attack surface by blacklisting the affected modules. None of esp4, esp6, or rxrpc are loaded on a typical workload that does not use IPsec transport mode or AFS, so on most systems this is safe to apply immediately: `sudo sh -c "printf 'install esp4 /bin/false\ninstall esp6 /bin/false\ninstall rxrpc /bin/false\n' > /etc/modprobe.d/dirtyfrag.conf; rmmmod esp4 esp6 rxrpc 2>/dev/null; true"` This writes a modprobe config that prevents the three modules from loading, and unloads them if they happen to be loaded already (the rmmmod is best-effort and silent if the module isn't present). To revert, remove `/etc/modprobe.d/dirtyfrag.conf`. The Dirty Frag exploit works by corrupting page-cache pages of sensitive files (such as `/etc/passwd` or `/usr/bin/su`). If you suspect the system may have already been targeted before you applied the mitigation, drop the page cache so any tampered pages are evicted and the next read comes fresh from disk: `sudo sh -c 'echo 3 > /proc/sys/vm/drop_caches'` This is safe to run on a live system — it only frees clean cache and dentry/inode entries — and pairs well with the blacklist above. Upcoming Fixes We are currently building some kernels with early patches applied: <https://gitlab.manjaro.org/packages/core/linux618/-/commit/0697d241a837a5b8ebca1dd96f925e5128cc3e09> <https://gitlab.manjaro.org/packages/core/linux70/-/commit/59260d1814aa06e6de935df9825a83a30f1ce5ad> You may want to switch to unstable branch as soon as they hit our repos or get them directly from our Github pages: Releases · manjaro-kernels/linux618 · GitHub Releases · manjaro-kernels/linux70 · GitHub All current kernels are vulnerable to this exploit, unless communicated otherwise! Update 2026-05-09 ESP issue (CVE-2026-43284) got fixed in most kernel trees as in: <https://cdn.kernel.org/pub/linux/kernel/v7.x/ChangeLog-7.0.5> <https://cdn.kernel.org/pub/linux/kernel/v6.x/ChangeLog-6.18.28> <https://cdn.kernel.org/pub/linux/kernel/v6.x/ChangeLog-6.12.87>

<https://cdn.kernel.org/pub/linux/kernel/v6.x/ChangeLog-6.6.138> <https://cdn.kernel.org/pub/linux/kernel/v6.x/ChangeLog-6.1.172>
<https://cdn.kernel.org/pub/linux/kernel/v5.x/ChangeLog-5.15.206> <https://cdn.kernel.org/pub/linux/kernel/v5.x/ChangeLog-5.10.255> Copy Fail 2: Electric Boogaloo is most likely patched with the already applied ESP patches on most kernels we now ship in our unstable branch. rxrpc issue (CVE-2026-43500) is not yet fixed at upstream at all. There is now a v3-patch under review, which applies to 6.18 and 7.0 kernel series. 46 posts - 22 participants Read full topic

- [Manjaro 26.1 Bian-May - Preview released](#) (2026/05/05 12:03)

Note: This is a preview release of the upcoming Manjaro 26.1 “Bian-May”! We are looking for your feedback on these install medias ... Manjaro 26.1 (Preview) Since we released Anh-Linh in January 2026 we worked hard to get the next release of Manjaro out there. We call it Bian-May. The GNOME edition has received several updates to Gnome 50 series. This includes a lot of fixes and polish when Gnome 50 originally was released in March 2026. You can find find release dates of each upcoming point-release here: [Release Calendar](#). Weekly updates around GNOME can be found here. Highlights of 50 release series are: GNOME’s parental controls have made a massive leap forward in GNOME 50. For the first time it is now possible for parents and guardians to monitor screen time and set limits for child accounts, including bedtime schedules. The new features allow automatically locking the screen when a screen limit or bedtime is reached. Parents and guardians also have the ability to extend screen time past the limit when needed. We also ship Big Parental Controls 1.0 from our sister-project Big Linux from Brazil, to comply with recent laws there. GNOME’s built-in remote desktop capabilities have seen significant improvements in version 50. A major performance boost comes from new hardware acceleration support (using Vulkan and VA-API). By using your computer’s graphics processor to stream video, remote sessions are now significantly smoother with much less lag and lower power consumption. Compatibility has also been improved for a wider range of hardware with the integration of explicit sync, which provides a more stable experience for those using NVIDIA drivers. GNOME’s display technologies have received a massive set of stability and performance updates in GNOME 50. Improved Variable Refresh Rate (VRR) and Fractional Scaling Support: VRR and fractional scaling have both been improved for GNOME 50, with bug fixes, stability, and user experience improvements. For users with compatible monitors, VRR provides a tear-free experience where the display’s refresh rate matches the application’s frame rate, resulting in significantly smoother motion. Fractional scaling allows what is displayed on screen to be scaled in increments, to better suit a range of display densities. When it is enabled, users can natively select scales like 125% or 150% in the display settings. Low-Latency Cursor in VRR: The mouse cursor now operates independently of the application’s frame rate while VRR is active. This ensures the cursor remains fluid and responsive at the monitor’s maximum refresh rate (e.g., 144Hz) even if a game or professional app is running at a lower frame rate. NVIDIA Performance Boosts: Workarounds for NVIDIA driver quirks have been implemented, targeting stuttering and frame-timing issues. The result is noticeably smoother window animations and general desktop fluidity for users with NVIDIA GPUs. Next-Gen Color Management: Support for version 2 of the Wayland color management protocol has landed. This provides the technical foundation for creative professionals to achieve higher color accuracy across different apps and hardware. HDR Screen Sharing: Building on GNOME’s modern color pipeline, it’s now possible to screen share monitors displaying High Dynamic range (HDR) content. This allows screen recording software to record the screen content with the same vivid colors as displayed on the physical screen. The Plasma edition comes with the latest Plasma 6.6 series, Frameworks 6.25 and KDE Gear 26.04. It brings exciting new improvements to your desktop. Plasma 6.6 includes a number of highly-requested features: Plasma makes your life as easy as possible, without sacrificing the flexibility or features that have made Plasma the most versatile desktop in the known universe. With that in mind, Plasma’s usability and accessibility got improved, and practical new features were

added into the mix. Those who like tailoring the look and feel of their environment can now turn their current setup into a new global theme! This custom global theme can be used for the day and night theme switching feature. If you have colorblindness, check out the filters on System Settings' Accessibility page, under Color Blindness Correction. Plasma 6.6 adds a new grayscale filter, bringing the total to four filters that account for different kinds of colorblindness. Speaking of accessibility, Spectacle can now recognize and extract text from images it scans. Among other use cases, this makes it easy to write alt texts for visually-impaired users. With Plasma Setup, the technical steps of operating system installation and disk partitioning can be handled separately from user-facing steps like setting up an account, connecting to a network, and so on. With our XFCE edition, we have now Xfce 4.20. Here some highlights: A new file highlighting feature (accessed from the file properties dialog) in Thunar file manager lets you set a custom colour background and a custom foreground text colour – an effective way to call attention to specific file(s) in a directory laden with similar-looking mime types. On the subject of finding files, Thunar includes recursive search. The panel picks up a pair of new preferences. First, panel length is now configured in pixels rather than percentages, as before. Second, there's a new "keep panel above windows" option. This allows maximised app windows to fill the area behind the panel rather than maximise its bottom or top edge to sit flush against it. Control Centre groups all of the desktop's various modules for managing the system into one easy-to-use window. New options are present in many of these. For example you can disable header bars in dialogs from the Appearance module; show or hide a 'delete' option in file context menus from Desktop; and pick a default multi-monitor behaviour before you attach an additional screen – dead handy, that. Kernel 7.0 is used for this release, such as the latest drivers available to date. With 6.18 LTS and 6.12 LTS we offer additional support for older hardware as needed. We hope you enjoy this release and let us know what you think of Bian-May. - [\[Stable Update\] 2026-05-02 - Kernels, Plasma, GNOME, Mesa, Systemd, VirtualBox, LibreOffice \(2026/05/02 20:16\)](#)

Hello Manjaro user community, here we have another set of package updates. We are continuing our development of the upcoming release of 'Bian-May' which can be expected end of May, beginning of June. This is a preview-release and not yet the final one, as more testing needs to be done. However, due to recent feedback, also due to CVE-2026-31431 I decided to push our current packages also to the stable branch for easier updating and securing your systems. If you added the mitigation workaround, you can remove it on patched kernels. I will see on when I may find time to test more our install medias, but might release Manjaro 26.1-preview as an option to install Manjaro with these package updates already included. So read the changelog and our troubleshoot guidelines for more details. Development speed may be a little slower the upcoming weeks. However, still let us know any issues you may have found thus far. - [\[ALERT\] CVE-2026-31431 - Local Privilege Escalation Vulnerability](#) (2026/05/02 06:52)

Was this AI-found? AI-assisted. The starting insight — that splice() hands page-cache pages into the crypto subsystem and that scatterlist page provenance might be an under-explored bug class — came from human research by Taeyang Lee at Xint. From there, Xint Code scaled the audit across the entire crypto/ subsystem in roughly an hour. Copy Fail was the highest-severity finding in the run. - Copy Fail — CVE-2026-31431 With the rapid evolution of AI - this is just the beginning... Don't panic Avoid untrusted code, scripts or apps, in any form. Local Privilege Escalation Vulnerability On 29 April 2026, a high local privilege escalation vulnerability in the Linux kernel, tracked as CVE-2026-31431 and named "Copy Fail", was publicly disclosed. The vulnerability affects Manjaro Linux since 2017. A public proof-of-concept exploit has been released. Unpatched kernel Patched kernel All kernels built before this incident is vulnerable The release manager has patched most of the kernels and released them to the testing and unstable branches. [Testing Update] 2026-05-01 - Kernels (CVE-2026-31431), NVIDIA, LibreOffice, Mesa, Deepin - #2 by discobot And with this comment Fri, May 1, 2026 10:00 PM UTC stable branch has been updated as well philm: Current stable update includes most kernels patched. Please avoid to use Realtime Kernels for now ... No longer needed - kept for historical purpose Summary (click for more details) 36 posts - 15 participants Read full topic
