

Manjaro on Reddit

- [LEA - LE Headphones not connecting](#) (2026/06/22 07:25)
Heya, so i got new lea Headphones and im having trouble connecting them to my laptop, well i connect them but the OS doesnt recognize that they are headphones (same on phone-but they work like headphones there) they dont appear in audio at all, and i couldnt find any post about this or anything. Thank you for any help submitted by /u/-Pokemain- [link] [comments]
- [pamac doesn't show available aur updates](#) (2026/06/21 11:12)
when trying with yay -Qua I can see that there are updates for some of my AUR packages but when trying with pamac checkupdates --aur, it reports that system is up to date. I've already tried to update the cache with pamac update --aur --force-refresh but it's the same as before. There's also an open issue in the pamac github repo that might be related: <https://github.com/manjaro/pamac/issues/559> note: all aur packages were installed via pamac submitted by /u/xita9x9 [link] [comments]
- [Which kernel to use?](#) (2026/06/20 12:32)
On my installation using the stable branch the 7.0 kernel seemed to be the default. Then I found there's also a 7.1 kernel optional. Because I like to try different kernels it now shows: `uname -r 6.6.135-1-rt74-MANJARO` For whom is the real-time kernel best? —and how to choose in general? submitted by /u/moritz12d [link] [comments]
- [Updating crashed. Restart PC. Cant boot anymore](#) (2026/06/16 21:14)
So like a dumbass i tried to update without checking for bugs and such. Was originally only going to update krita but somehow my brain just went ahead and updated everything. Was using the kde software manager. Everything was going fine until it just closed all of the sudden. It didnt appear in task manager. Figured i would just restart and try again. Doent boot in linux anymore. Error: file /boot/vmlinuz*** not found. Read about trying to reinstall kernel with live usb. Entered chroot. Enter pacman -Syu linux . After it check packages and conflicts, get error failed to commit transaction (conflicting files). A few hundred lines starting with gcc15: /blablafilepath exists in filesystem. no packages were upgraded. Googling lead me to answers involving forcing or removing those files. I dont know what i'm doing. Also I dont know if any of this has anything to do with the recent aur shitstorm, which is another problem i'll have to check out. EDIT. after forcing the update with pacman -Syuu --overwrite updating finished and everything seems to have worked out well. boots up as usual. submitted by /u/cannimal [link] [comments]
- [Musescor 4.6.5 Not working properly](#) (2026/06/16 07:55)
I got myself some new sheetmusic yesterday, but I can't get it saved in a way I can export as pdf. I can't save it as an mscx file, saving it as a folder doesn't make it possible to export it as pdf, and when I tried an older version after I found out Musescor 4.6.5 doesn't like Arch, it crashed whenever I tried to save. fuse-common is installed along with all dependencies. How do I get it saved properly? Edit: Problem's solved. submitted by /u/Mutated_zombiebush [link] [comments]
- [New Linux User , Should I be worried ?!](#) (2026/06/15 11:28)
On june 11th-12th I switched to manjaro, downloaded it, updated all the packages, and got minecraft modrinth from the AUR, also updated some packages from the store, but they weren't downloading properly, today I learnt there was a Malware attack :) Am I fucked ? submitted by

- [Pamac AUR Update Delay - give AUR packages time to cool down before they appear in updates](#) (2026/06/14 14:16)

After the recent discussion about AUR package safety in Active AUR malicious packages incident (Active AUR malicious packages incident), I've put together a small feature that lets users delay AUR updates from appearing in the update scan. A new setting, "Delay showing AUR updates (days)", is available in Preferences > Third Party > AUR. When set to a non-zero number of days, any AUR package whose upstream LastModified timestamp is newer than that age is hidden from the normal update scan. Default is 0 or behavior unchanged. The delay only applies to the passive update scan (pamac-checkupdates, tray notifications, the Updates tab). It does not block manual installs, builds, or full upgrades. If you explicitly ask Pamac to build or upgrade a package, it will still do so. The work is split across the two repositories: libpamac PR (feat: add AUR update delay setting by wandercone · Pull Request #8 · manjaro/libpamac · GitHub): adds the config key AURUpdateDelayDays and the age filter in the update scanner. pamac PR (feat: add AUR update delay setting by wandercone · Pull Request #572 · manjaro/pamac · GitHub): adds the user editable configuration within Preferences and wires it to the new setting. Users accept very real risks when installing software from the AUR. As one forum moderator put it: "...one can explain that the soup is hot, but that does not prevent those hungry from burning their lips.". This change gives the user a thermometer, an optional delay that lets AUR packages cool down before they appear in the update scan. One of Manjaro's defining traits is its measured approach to updates. Unlike Arch's immediate upstream sync, Manjaro holds repository packages through testing and unstable branches so issues can surface before they reach the stable user base. This feature brings a similar safety margin to the AUR, an optional cooling-off period, that keeps just-published commits off the update scan until they have had time to be reviewed in the wild. Link to forum post which was made unlisted:

<https://forum.manjaro.org/t/pamac-aur-update-delay-give-aur-packages-time-to-cool-down-before-they-appear-in-updates/188322/> submitted by /u/canfail [link] [comments]

- [Small read-only script to check if any of the compromised AUR package names are installed](#) (2026/06/12 20:41)

submitted by /u/ramonvanraaij [link] [comments]

- [AUR and Malware](#) (2026/06/12 19:53)

Heard of this via the Manjaro discord server, but haven't seen it reported here here (that I found with a quick search). There's been an attack on the AUR involving some 400 malicious packages being compromised in the last couple of weeks, as reported by Phoronix. If you have any of these AUR packages installed, now would be a good time to remove them You can get a list of AUR packages with pamac by using `pamac list --foreign`, and compare what you have to this list. Background: Arch mailing list thread thread I'd also recommend to those new to Arch/Manjaro to please use the AUR with an abundance of caution. Avoid using it whenever possible, and be sure of packages you are installing when you do.

- [\[Cinnamon\] Some settings randomly changed, don't know how.](#) (2026/06/12 17:52)

So one day I booted up and noticed some settings were changed, specifically My audio didn't play for notifications or anything, so login.oga, etc were missing. They were on system and I was able to restore it. Mounted drives and some desktop icons didn't show up; so the default ones like home and trash. Flickign those on fixed it. But I don't know what caused that; I hadn't installed anything weird in the AUR; or anything in while, so I don't think it's that. I hadn't seen anything else and smartctl isnt pointing to any drive failures, and it was normal on the 8th. Pamac had some updates but iirc there wasn't anything for Cinnamon. My monitor was giving issues but that wasn't unique to this system. Maybe I'm being

paranoid but with a bunch of stuff failing on me already, I'm trying to be extra cautious in case somethings about to break. submitted by /u/These_Day_2250 [link] [comments]

- [Anyone try Cosmic?](#) (2026/06/10 15:32)

Got annoyed with a GNOME bug where it struggles to remember multi display set ups between sessions so decided to try Cosmic. Didn't have high hopes given all the complaints about Pop having lots of bugs, but am actually really impressed. It's pretty customisable now, it looks great (and more modern than any other DE) and performance is smooth. A couple of things are still lacking. No real support for drawing tablets, the file manager isn't very powerful, no nightlight mode yet. But overall it's a great option and good to see some competition for KDE and Gnome- it's a nice balance between the two in terms of polish vs customisability. I'm thinking most of the bugs must be with Pop rather than the DE- was a bit dubious as to how compatibility would be with an Arch-based distro, but seems smooth sailing so far. submitted by /u/Slopagandhi [link] [comments]

- [Weird steam crashes](#) (2026/06/07 12:53)

Hey, total nooby here. So, in many games I'm playing in steam via proton or in the native form, such as Victoria 3 or Paralives, during the loading section the game crashes and this message appears. I have seen people with similar problems, but during their gameplay, but not on the loading. I managed to make Vic 3 work by swapping the Proton version until I found one that worked, but still it's not reliable. What Should I do? I'm using Manjaro in an ideapad gaming powered by an nvidia card 256mb of video RAM. Thanks in advance submitted by /u/Evening-Fix1610 [link] [comments]

- [Laptop no longer giving out video output after installing proprietary nvidia driver.](#) (2026/06/01 12:03)

I have an acer aspire 7 whose screen is not working so I removed it's screen and turned it into an half-top. I had Manjaro Linux on it. After booting my laptop, the gui did not work but I was still able to access the terminal. In order to fix this I was messing around and ran 'sudo mhwd -a pci nonfree 0300 --force'. After running this command I rebooted my pc. After that the laptop is booting up(backlit keyboard turns on and the usb ports give out power) but the external display is showing no signal. How do I fix this? submitted by /u/VedAsish [link] [comments]

- [Two packages changes \(taken?\) by same guy](#) (2026/05/30 14:03)

So this is about AUR packages. A notification popped to update two packages which I did not recognize. I looked at them, nothing interesting, they are actually pretty dead/unmaintained... but the changes is what caught my eye. For both of them, the changes are by some new guy: "Andreas Baumann", never before he made any changes and his email is not archlinux... Did he take over maintaining these? Packages are: accounts-qml-module ; libkcompactdisc submitted by /u/dstark1993 [link] [comments]

- [Fresh install. Nothing else.](#) (2026/05/29 23:27)

All I did was install Manjaro. That's it. It'll boot just fine but after about 10 seconds after the welcome box it does this. Any ideas what might be going on? submitted by /u/jakobair [link] [comments]

- [How to install working Davinci resolve on Manjaro with no issues](#) (2026/05/29 03:15)

"My Documentation on installing Davinci Resolve on Linux" My current environment/workspace: `uname -r =>6.12.39-1-MANJARO` (Arch based) `echo $XDG_CURRENT_DESKTOP =>Hyprland` (Window Manager or Desktop Environment ["also tested with xfce distro"]) `echo $XDG_SESSION_TYPE => wayland` `systemctl status display-manager => sddm.service` (Display Manager) {NOTE: "lightdm" didn't work with wayland} `gst-launch-1.0 --version => GStreamer 1.14.1` (Media Engine) `nvidia-smi => NVIDIA-SMI 575.64.05` (Nvidia Drivers) NOTE: {if you want

to run on gpu then assure, you have all drivers of nvidia (check by: nvidia-smi)} Step1: Download the davinci resolve for linux from official site. Step2: unzipe the file >unzip DaVinci_Resolve_*_Linux.zip Step3: Install >sudo ./DaVinci_Resolve_20.3_Linux.run -i Step4: Launch the application >/opt/resolve/bin/resolve {Finish} Launch Error: #if after launch this error comes >/opt/resolve/bin/resolve: symbol lookup error: /usr/lib/libpango-1.0.so.0: undefined symbol: g_once_init_leave_pointer {then simply paste this command} > cd /opt/resolve/libs sudo mkdir disabled-libraries sudo mv libglib* disabled-libraries sudo mv libgio* disabled-libraries sudo mv libgmodule* disabled-libraries Offline Media Error: #if media is not showing offline {then use ReLink Media} Media format Error: #if you are seeing black screen then most of the time it is a video format error NOTE: {.mp4/hevc/mkv format is not supported by Davinvi Resolve linux (FREE-Version)} convert it into .mov(container) format using "ffmpeg" package Supported codec: DNxHD/DNxHR and ProRes {Recommended: DNxHD} Black Screen Error: #if you are still seeing black screen after resolving media format error {then} *insure media directory *insure .mov format *insure all NVIDIA/AMD drivers are installed} *check OpenCL/CUDA *check in fusion page: MediaIn and MediaOut should be connected Black Screen but not on fusion page(GStreamer{Media Engine} Error): #if your video viewer is fine on fusion page but not on edit/color pages {then it should be problem of libraries} #Running Resolve directly using the binary:"/opt/resolve/bin/resolve" #causes Resolve to pick up system GStreamer 1.24 libraries instead of its own bundled GStreamer." #The proper Resolve launcher is usually a wrapper script that sets LD_LIBRARY_PATH , but in this case, Manjaro/Arch install did NOT include the wrapper. {So we created our own.} # {FINAL SOLUTION FOR BLACK SCREEN}# >~/local/bin/resolve-nvidia with this content: `` `#!/bin/bash # Force NVIDIA GPU export __NV_PRIME_RENDER_OFFLOAD=1 export __GLX_VENDOR_LIBRARY_NAME=nvidia 2export __VK_LAYER_NV_optimus=NVIDIA_only # Force Resolve to use its own internal libraries export LD_LIBRARY_PATH="/opt/resolve/libs:/opt/resolve/bin/:\$LD_LIBRARY_PATH" # Launch Resolve exec /opt/resolve/bin/resolve `` {then} >chmod +x ~/local/bin/resolve-nvidia >resolve-nvidia submitted by /u/No-Pirate-4706 [link] [comments]

- [Importing Home Folder from Linux Mint](#) (2026/05/28 20:53)

Hello - I'm looking for some advice on switching to Manjaro from Mint. I'm not a tech dummy, but I'm also not the most proficient power user either: From time to time, I've broken things in Mint and have had to start over (actually, this has only happened once so far but I'm sure it'll happen again). I simply reinstall Mint and then rsync my home folder backup to the new installation and *everything* comes back just as I left it. (I include all of the hidden/config files in my backups). If I install Manjaro and do the same thing, will everything work just the same? Also - I tried Manjaro before and was unable to get NordVPN working. Is this only doable on Debian-based distributions? submitted by /u/edmc215 [link] [comments]

- [Transient zsh prompt set to always after recent update](#) (2026/05/20 06:31)

One of the updates was to manjaro zsh config, which I'm assuming is the cause. Anyone know where I might find the setting to disable it? submitted by /u/Chronigan2 [link] [comments]

- [Need help with auto mounting disk](#) (2026/05/17 11:03)

I have just recently switched to manjaro, and am struggling with getting my ssd to mount automatically. I have three drives overall ssd1 which is for my OS ssd2 which is our trouble maker, and a spare hdd. SSD1 mounts no problem, HDD wise I had to set a mount point and the issue was over. Tried to do the same with ssd2 and it doesn't work (I have simply set the mountpoint to /mnt). The ssd mounts easily when I do it manually

after I typed in my password. What am I still doing wrong so it mounts on booting my system? I do still struggle with understanding some of the tech terms in the other forums. Any help appreciated! submitted by /u/Fuckthatfuckingshit [link] [comments]

- [Power Manager Question](#) (2026/05/16 20:48)

I switched over to Manjaro from Windows this past December, and I have loved every minute of it. 99.9% of everything worked right out of the box and the 0.1% of things that didn't was easily fixed. One thing that I don't know how to fix though is the power manager. The power manager displays crazy high numbers for my remaining battery (3000+ hours remaining). At first it made me giggle and I didn't need to worry about it as I am rarely in an environment where I have to worry about my battery dying. That isn't that case anymore and I wondering what I need to do to make the number more accurate. If it matters, I am using a Acer Spin 5, with an Intel i5 8th gen. submitted by /u/TinyTheory2601 [link] [comments]

- [Which one is better for editing videos?](#) (2026/05/14 05:50)

I used to use capcut when I was an windows user, then I tried da vinci but I only have an 8gb ram old laptop so it's just too slow. then I tried kdenlive but it doesn't even oepn on fullscreen. (My laptop have a smaller screen) and openshot is like too dumb, I cannot even see the audio spectrum. Can anyone help? :< submitted by /u/Aggressive_Talk_1126 [link] [comments]

- [Remove Shortcut Overlay on Sway](#) (2026/05/12 09:38)

I've just started with Manjaro Sway (which has quickly become my favourite). I was just wondering which part of the config file I need to edit to remove the shortcuts overlay. Thanks in Advance. submitted by /u/monseieurSimpliste [link] [comments]

- [Bluetooth or audio not working.](#) (2026/05/11 17:56)

I have connected my jlab studio pro to my laptop with manjaro kde and when i go to play sound it doesn't work in wayland and it doesn't show up as an audio option. In X11 it does show up as an audio option but will only play mono not through high fidelity when selecting high fidelity it stops playing audio. also no video will play on youtube or vlc unless its on mono in X11 everything works just fine on my desktop with the same setup. Laptop is a dell latitude 3550. submitted by /u/NEXALITY00 [link] [comments]
